

Full Stack & Open Source Development – Data Sheet

Full Stack & Open Source Software Development

How we can help

At Infolob, we are huge proponents of open source software and strive to help other companies adopt open source development.

We partner with three of the largest NoSQL database programs in the world: Couchbase, MongoDB, and Apache Cassandra.

Our consultants are skilled in both the MEAN (Mongo, Express, Angular, and Node) stack and the MERN (Mongo, Express, React, and Node) stack and have the ability to either redesign applications or build them from scratch using programs like Angular JS and React JS.

About Full Stack & Open Source

Open source development uses code that is free and readily available to the public in order to create applications and programs. It is generally a collaborative effort that ends up saving money for consumers, since both the code and distribution have limitless availability.

Since the source code has an open source software license, the software is able to be repurposed, re-engineered, or even marketed differently based on the consumer's needs. The collaboration helps build connections for businesses and individuals, and there is not much of a chance that the software will become unavailable in the future.
